SoftPOS – payment acceptance on smartphone

The principle of softPOS is to offer a lightweight, convenient and secure solution accessible to all merchants, using only their smartphone to start accepting payment cards without the need for additional card reader.

SoftPOS is ideal to convert small and micro businesses to digital payment technology.

It also completes existing POS systems with increased checkout mobility and convenience.

Alcinéo offers a softPOS SDK to payment solution providers. Our flexible and secure approach allows them to customize their solution and reduce time to market.

The SoftPOS solution offers a simple alternative to traditional payment terminal. It embeds EMV payment software and meets the tap-to-phone requirements issued by major payment schemes.

It provides a high-end level of security and data protection, using tokenisation and other encryption methods to ensure the safety of sensitive transaction data all the way through the digital payment process.

About Alcinéo :

Alcinéo develops embedded software and security solutions integrating innovative payment systems in all markets. SoftPOS solution drives this innovation, offering to all merchants an accessible and secure alternative to accept payment cards. Our products and solutions are at the forefront of technology to provide secure digital payment solutions to customers.
